

Advanced Ra6000 Ptt System Product Launch At AUSA

Military communication specialist Esterline Racal Acoustics, is set to launch its new RA6000 PTT System at this years AUSA Annual Meeting in Washington D.C.

Today's soldiers are challenged by the increasing adoption of communication equipment through all aspects of their missions, including personal radios, ground and air based intercoms and radio platforms, needing to continuously monitor and transmit on these multiple nets.

Esterline Racal Acoustics has developed the advanced RA6000 PTT System, an ergonomically designed four channel Press-To-Talk (PTT) unit which provides simple connectivity to multiple communication sources. A convenient asset for mounted and dismounted operators alike, RA6000 allows the soldier to continuously monitor four communication channels simultaneously, typically two Soldier Radios, plus platform intercom and platform radio, and selectively transmit on them via four ergonomic and intuitive PTT buttons.

With a choice of headset style to suit the mission profile, including Circumaural and In-the-ear types, and supporting Talk-Through (TT) and Active Noise Reduction (ANR) technology, RA6000 delivers Enhanced Intelligibility, excellent Situational Awareness, and Hearing Protection against impulse (IED blast / weapons discharge) and continuous noise (vehicle /aircraft) on the battlefield.

Ideally suited for all commonly used soldier radio platforms, aircraft and vehicle intercom systems and platform radios, the RA6000 PTT System with its ergonomic design and advanced feature set, leads the way in providing comprehensive hearing protection and enables the soldier to simply and intuitively manage multiple communication sources. Rob Harrison, Product Manager, will be available to discuss your requirements for the RA6000 PTT System on the Esterline stand # 704. Please contact us if you are interested in securing a demonstration at AUSA.
